plt.show()
```

Based on theh observations above, The MD 83 is the safest Airplane considering that it has the highest Uninjured rate. However, this view does not tell the complete story as it only appeared in 1 Event and 512 passengers were uninjured.

A better way would be to add a column called Decade and consider the number of uninjured passengers grouped by Airplane Make and Model. This way it becomes easier to tell the uninjured passengers over the decades for all accident events.

```
In [ ]: #Creating a frequency sort of range for years in decades, a new column for the decade range, e.g "1974-1983"
                  Airplane Data['Event.Date'] = pd.to datetime(Airplane Data['Event.Date'])
                  #Function to create the Decade range
